## AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims

1. (Currently amended) A plasma processing apparatus, which performs a plasma

process for the reverse face of a wafer for which an insulating sheet is adhered to the obverse

face and which, for the plasma process, handles at least two wafersizes of wafer, a large wafer

and a small wafer, comprising:

an integrally formed electrode member, which is located in a process chamber that

defines a closed space and which has a mounting face larger than a large wafer so that a wafer

can be mounted while the insulating sheet is contacting the mounting face;

a pressure reduction unit, for discharging a gas from the closed space to reduce pressure;

a gas supply unit, for supplying a plasma generation gas to the closed space in which the

pressure has been reduced;

an opposing electrode, positioned opposite the electrode member;

a plasma generator, for applying a high frequency voltage between the electrode member

and the opposing electrode to set the plasma generation gas into a plasma state:

a DC voltage application unit, for applying a DC voltage to the electrode member to

electrostatically attract the wafer positioned on the mounting face;

a cooling unit for cooling the electrode member; and

a cover member, which has a ring shape and which is detachably covering outer portion

of the mounting face, an inner diameter of the cover member being substantially equal to an

outer diameter of the wafer placed on the mounting face,

wherein the mounting face of the electrode member is divided into

Page 2 of 10

Reply to Office action dated August 21, 2009

a first area, which is located in the center of the mounting face, wherein a metal,

the material used for the electrode member, is exposed,

a first insulating area, the surface of which is covered with an insulating film, that

encloses, like a ringin a ring-like manner, the outer edge of the first area,

a second area, wherein the metal is exposed, that is extended, like a ring in a ring-

like manner, around the outer edge of the first insulating area, and

a second insulating area, the surface of which is covered with an insulating film.

that encloses, like a ringin a ring-like manner, the outer edge of the second area, wherein the

surface of the second insulating area extends to a peripheral edge of the mounting face,

wherein a boundary between the first area and the first insulating area is designated inside

the outer edge of [[a]]the small wafer positioned in the center of the mounting face, [[and ]]a

boundary between the first insulating area and the second area is designated outside the outer

edge of the small wafer, and the first area and the first insulating area directly support the small

wafer mounted on the insulating sheet, and

wherein a boundary between the second area and the second insulating area is designated

inside the outer edge of [[a]]the large wafer positioned in the center of the mounting face, [[and

]]the second insulating area extends outward from the large wafer, and the first area, the first

insulating area, the second area, and the second insulating area directly support the large wafer

mounted on the insulating sheet.

2. (Original) A plasma processing apparatus according to claim 1, wherein said

cover member completely covers the second area.

Page 3 of 10

 (Original) A plasma processing apparatus according to claim 2, wherein the cover member is attached to the mounting face when a small wafer is to be processed, or is

removed from the mounting face when a large wafer is to be processed.

4. (Original) A plasma processing apparatus according to claim 2, wherein the

cover member is made of ceramic.

5. (Original) A plasma processing apparatus according to claim 2, wherein the

cover member is formed of a thick outer ring and a thin internal ring that engages the thick outer

ring.

6. (Original) A plasma processing apparatus according to claim 1, wherein the

insulating film covering the first insulating area and the insulating film covering the second

insulating area are made of aluminous ceramic.

7. (Original) A plasma processing apparatus according to claim 3, further

comprising:

a plurality of suction holes formed in the first area and the second area;

a vacuum suction unit for creating a vacuum and producing suction that, through the

suction holes, draws the wafer to and holds the wafer on the mounting face; and

a blocking member, having a ring shape, that is attached to the second area, when the

cover member is mounted on the mounting face, to block the plurality of suction holes in the

second area,

Page 4 of 10

wherein the cover member completely covers the blocking member.

8. (Original) A plasma processing apparatus according to claim 6, wherein the

blocking member is formed by adhering, to one face of a ring-shaped plate made of the same

material as the wafer, an insulating sheet made of the same material as the insulating sheet that is

adhered to the wafer.

9

(Currently amended) A plasma processing apparatus according to the present

invention, which performs a plasma process for the reverse face of a wafer for which an

insulating sheet is adhered to the obverse face and which, for the plasma process, can handle at

least two waferssizes of wafer, a large wafer and a small wafer, comprising:

an integrally formed electrode member, which is located in a process chamber that

defines a closed space and which has a mounting face larger than a large wafer so that a wafer

can be mounted while the insulating sheet is contacting the mounting face;

a pressure reduction unit, for discharging a gas from the closed space to reduce pressure;

a gas supply unit, for supplying a plasma generation gas to the closed space in which the

pressure has been reduced;

an opposing electrode, positioned opposite the electrode member;

a plasma generator, for applying a high frequency voltage between the electrode member

and the opposing electrode to set the plasma generation gas into a plasma state;

a DC voltage application unit, for applying a DC voltage to the electrode member to

electrostatically attract the wafer positioned on the mounting face; and

a cooling unit for cooling the electrode member.

wherein the mounting face of the electrode member is divided into

a first area, which is located in the center of the mounting face, wherein a metal,

the material used for the electrode member, is exposed,

a first insulating area, the surface of which is covered with an insulating film, that

encloses, like a ringin a ring-like manner, the outer edge of the first area,

a second area, wherein the metal is exposed, that is extended, like a ringin a ring-

like manner, around the outer edge of the first insulating area, and

a second insulating area, the surface of which is covered with an insulating film,

that encloses, like a ringin a ring-like manner, the outer edge of the second area, wherein the

surface of the second insulating area extends to a peripheral edge of the mounting face,

wherein a boundary between the first area and the first insulating area is designated inside

the outer edge of [[a]]the small wafer positioned in the center of the mounting face, [[and ]]a

boundary between the first insulating area and the second area is designated outside the outer

edge of the small wafer, and the first area and the first insulating area directly support the small

wafer mounted on the insulating sheet,

wherein a boundary between the second area and the second insulating area is designated

inside the outer edge of [[a]]the large wafer positioned in the center of the mounting face, [[and

]]the second insulating area extends outward from the large wafer, and the second insulating area

is located outside the outer edge of the large wafer, and the first area, the first insulating area, the

second area, and the second insulating area directly support the large wafer mounted on the

insulating sheet,

Page 6 of 10

wherein a plurality of suction holes are formed in the first and the second areas and a

vacuum suction unit is provided to create a vacuum and produce suction that, through the suction

holes, draws the wafer to and holds the wafer on the mounting face, and

wherein a cover member, which has a ring shape and which is detachable from the

mounting face, is closely adhered across the entire face of the second area to completely cover

all the suction holes formed in the second area.

10. (Original) A plasma processing apparatus according to claim 9, wherein the

cover member is attached to the mounting face when a small wafer is to be processed, or is

removed from the mounting face when a large wafer is to be processed.

11. (Original) A plasma processing apparatus according to claim 9, wherein the

cover member has a main body made of ceramic, and a resin layer is deposited at a location, on

the lower face of the main body, that contacts the second area.

12. (Original) A plasma processing apparatus according to claim 9, wherein the

cover member has an outer ring and an internal ring that engages the outer ring, and a resin layer

is deposited at a location, on the lower face of the inner ring, that contacts the second area.

13. (Original) A plasma processing apparatus according to claim 9, wherein the

insulating film covering the first insulating area and the insulating film covering the second

insulating area are made of aluminous ceramic.
